

Challenge Lab: Python Scripting Exercise

Duration

This lab takes approximately **40 minutes** to complete.

Launch Your Lab Environment

1. At the top of these instructions, click **Start Lab** to launch this lab.

A Start Lab panel opens displaying the lab status.

2. Wait until you see the message "**Lab status: ready**", then click the **X** to close the Start Lab panel.

This lab launches an EC2 instance named **Linux Host**. You will use this server to develop Python scripts.

3. Click the **Details** drop down menu above these instructions, and then click **Show**.

Copy the value of the **ips -- public** field to a text file and save the file as **Lab Details.txt**, using a text editor such as [Atom](#), [Sublime Text](#) or [Visual Studio Code](#). This value is the public IP address of the Linux Host.

The information you have saved will be referred to as [Lab Details](#) in the lab.

Using SSH to Connect to the Linux Host

Windows Users: Using SSH to Connect

► These instructions are specifically for Windows users. If you are using macOS or Linux, [skip to the next section](#).

4. Select the **Details** drop-down menu above these instructions you are currently reading, and then select **Show**. A Credentials window will be presented.

5. Select the **Download PPK** button and save the **labsuser.ppk** file.

Typically your browser will save it to the Downloads directory.

6. Make a note of the **PublicIP** address.

7. Then exit the Details panel by selecting the **X**.

8. Download **PuTTY** to SSH into the Amazon EC2 instance. If you do not have PuTTY installed on your computer, [download it here](#).

9. Open **putty.exe**

10. Configure your PuTTY session by following the directions in the following link: [Connect to your Linux instance using PuTTY](#)

11. Windows Users: [Select here to skip ahead to the next task.](#)

macOS and Linux Users

These instructions are specifically for Mac/Linux users. If you are a Windows user, [skip ahead to the next task.](#)

12. Click the **Details** drop down menu above the instructions you are currently reading, and then click **Show**. A Credentials window will be presented.

13. Click the **Download PEM** button and save the **labsuser.pem** file.

14. Exit the Details panel by clicking the **X**.

15. Open a terminal window, and change directory `cd` to the directory where the *labsuser.pem* file was downloaded.

For example, if the *labsuser.pem* file was saved to your Downloads directory, run this command:

```
cd ~/Downloads
```

16. Change the permissions on the key to be read-only, by running this command:

```
chmod 400 labsuser.pem
```

17. Run the command below (*replace <public-ip>* with the **Linux Host IP address** you saved in the [Lab Details](#) file earlier).

```
ssh -i labsuser.pem ec2-user@<public-ip>
```

18. Type `yes` when prompted to allow the first connection to this remote SSH server.

Because you are using a key pair for authentication, you will not be prompted for a password.

Your Challenge

- Write a **Python script** to:
 - Display all the **prime numbers between 1 to 250**.
 - Store the results in a **results.txt** file.
- Test the script. Verify that it produced the expected results in the **results.txt** file.
- **Save the script and make a note of its location (absolute path)** for future reference.

Note: Both Python 2 and Python 3 are installed on the Linux Host. It is recommended to use Python 3. To run a Python script using version 3, run the following command by replacing *file.py* with your file name.

```
python3 file.py
```

Lab Complete

When you are finished with the lab:

19. Click **End Lab** at the top of this page and then click **Yes** to confirm that you want to end the lab. A panel will appear indicating that "Lab resources are stopping."
20. Click the **X** in the top right corner to close the panel. Your lab resources are persisted and accessible to you when you start the lab again.
